Abstract
In the paper we formulate a Covering Property Axiom CPA\textsubscript{prism}, which holds in the iterated perfect set model, and show that it implies the following facts of which (a) and (b) are the generalizations of results of Steprän [26].

(a) There exists a family \(\mathcal{F}\) of less then continuum many \(C^1\) functions from \(\mathbb{R}\) to \(\mathbb{R}\) such that \(\mathbb{R}^2\) is covered by functions from \(\mathcal{F}\) in the sense that for every \(\langle x, y \rangle \in \mathbb{R}^2\) there exists an \(f \in \mathcal{F}\) such that either \(f(x) = y\) or \(f(y) = x\).

(b) For every Borel function \(f: \mathbb{R} \to \mathbb{R}\) there exists a family \(\mathcal{F}\) of less than continuum many \(C^1\) functions (i.e., differentiable functions with continuous derivatives, where derivative can be infinite) whose graphs cover the graph of \(f\).

\*AMS classification numbers: Primary 26A24; Secondary 03E35.
Key words and phrases: continuous, smooth, covering.
The work of the first author was partially supported by NATO Grant PST.CLG.977652 and 2002/03 West Virginia University Senate Research Grant.
†The second author wishes to thank West Virginia University for its hospitality during 1998–2001, where the results presented here were obtained.
(c) For every $n > 0$ and a $D^n$ function $f : \mathbb{R} \to \mathbb{R}$ there exists a family $\mathcal{F}$ of less than continuum many $C^n$ functions whose graphs cover the graph of $f$.

We also provide the examples showing that in the above properties the smoothness conditions are the best possible. Parts (b), (c), and the examples are closely related to work of Olevskii [24].

1 Basic notation

Our set theoretic terminology is standard and follows that of [9]. In particular, $|X|$ stands for the cardinality of a set $X$ and $c = |\mathbb{R}|$. The Cantor set $2^\omega$ will be denoted by a symbol $\mathcal{C}$. We use term Polish space for a complete separable metric space without isolated points. A subset of a Polish space is perfect if it is closed and contains no isolated points. For a Polish space $X$ symbol Perf$(X)$ will stand for a collection of all subsets of $X$ homeomorphic to the Cantor set $\mathcal{C}$. Thus, in general, Perf$(X)$ is just a (coinitial) subfamily of the family of perfect subsets of $X$, though these two collections coincide if $X$ is zero dimensional. For a fixed $0 < \alpha < \omega_1$ and $0 < \beta \leq \alpha$ a symbol $\pi_\beta$ will stand for the projection from $\mathcal{C}^\alpha$ onto $\mathcal{C}^\beta$. We will always consider $\mathcal{C}^\alpha$ with the following standard metric $\rho$: fix an enumeration $\{\langle \beta_k, n_k \rangle : k < \omega \}$ of $\alpha \times \omega$ and for distinct $x, y \in \mathcal{C}^\alpha$ define

$$\rho(x, y) = 2^{-\min\{k < \omega : x(\beta_k)(n_k) \neq y(\beta_k)(n_k)\}}.$$  (1)

An open ball in $\mathcal{C}^\alpha$ with a center at $z \in \mathcal{C}^\alpha$ and radius $\varepsilon > 0$ will be denoted by $B_\alpha(z, \varepsilon)$. Notice that in this metric any two open balls are either disjoint or one is a subset of the other. Also for every $\gamma < \alpha$

$$\pi_\gamma[B_\alpha(s, \varepsilon)] = \pi_\gamma[B_\alpha(t, \varepsilon)] \text{ for every } s, t \in \mathcal{C}^\alpha \text{ with } s \upharpoonright \gamma = t \upharpoonright \gamma.$$  (2)

It is also easy to see that any $B_\alpha(z, \varepsilon)$ is a clopen set.

We will use standard notation for the classes of differentiable partial functions from $\mathbb{R}$ into $\mathbb{R}$. Thus, if $X$ is an arbitrary subset of $\mathbb{R}$ without isolated points we will write $C^0(X)$ or $C(X)$ for the class of all continuous functions $f : X \to \mathbb{R}$ and $D^1(X)$ for the class of all differentiable functions $f : X \to \mathbb{R}$, that is, those for which the limit

$$f'(x_0) = \lim_{x \to x_0, x \in X} \frac{f(x) - f(x_0)}{x - x_0}$$
exists and is finite for all \( x_0 \in X \). Also, for \( 0 < n < \omega \) we will write \( D^n(X) \) to denote the class of all functions \( f: X \to \mathbb{R} \) which are \( n \)-times differentiable with all derivatives being finite and \( \mathcal{C}^n(X) \) for the class of all \( f \in D^n(X) \) whose \( n \)-th derivative \( f^{(n)} \) is continuous. Symbol \( \mathcal{C}^\infty(X) \) will be used for all infinitely many times differentiable functions from \( X \) into \( \mathbb{R} \). In addition, we say that a function \( f: X \to \mathbb{R} \) is in the class \( \mathcal{C}^\infty(X) \) when \( f \) is in \( \mathcal{C}^n(X) \) and its \( n \)-th derivative is continuous when its range \([-\infty, \infty]\) is considered with the standard topology. \( \mathcal{C}^\infty(X) \) will stand for all infinitely many times differentiable functions from \( X \) into \( \mathbb{R} \). In addition, we say that a function \( f: X \to \mathbb{R} \) is in the class \( \mathcal{C}^\infty(X) \) when \( f \) is in \( \mathcal{C}^n(X) \) and its \( n \)-th derivative is constant equal to \( +\infty \) or \( -\infty \). (Thus, in general, \( \mathcal{C}^\infty(X) \) is not a subclass of \( \mathcal{C}^n(X) \).) In addition we assume that functions defined on a singleton are in the \( \mathcal{C}^\infty \) class, that is, \( \mathcal{C}^\infty(\{x\}) = \mathbb{R}^{\{x\}} \).

We will use these symbols mainly for \( X \)’s which are either in the class \( \text{Perf}(\mathbb{R}) \) or are the singletons. In particular, \( \mathcal{C}^\infty_{\text{perf}} \) will stand for the union of all \( \mathcal{C}^n(P) \) for which \( P \subset \mathbb{R} \) is either in \( \text{Perf}(\mathbb{R}) \) or a singleton. The classes \( \mathcal{D}^n_{\text{perf}}, \mathcal{C}^\infty_{\text{perf}}, \) and \( \mathcal{C}^\infty_{\text{perf}} \) are defined the similar way. We will drop parameter \( X \) if \( X = \mathbb{R} \). In particular, \( \mathcal{D}^n = \mathcal{D}^n(\mathbb{R}) \) and \( \mathcal{C}^n = \mathcal{C}^n(\mathbb{R}) \). The relations between these classes for \( n < \omega \) are given in a chart below, where arrows \( \longrightarrow \) indicate the strict inclusions \( \subset \).

![Chart 1](chart.png)

In addition for \( F \subset \mathbb{R}^2 \) we define \( F^{-1} = \{ (y, x) : (x, y) \in F \} \) and for \( \mathcal{F} \subset \mathcal{P}(\mathbb{R}^2) \) we put \( \mathcal{F}^{-1} = \{ F^{-1} : F \in \mathcal{F} \} \).

2 **Axiom CPA\textsubscript{prism}**

Axiom CPA\textsubscript{prism} is a simpler version of the axiom CPA which is described in [13]. The main notion needed for the axiom is that of a prism and prism-density.
Let $A$ be a non-empty countable set of ordinal numbers and let $\Phi_{\text{prism}}(A)$ be the family of all continuous injections $f: \mathcal{C}^A \rightarrow \mathcal{C}^A$ with the property that

$$f(x) \upharpoonright \alpha = f(y) \upharpoonright \alpha \iff x \upharpoonright \alpha = y \upharpoonright \alpha$$

for all $\alpha \in A$ and $x, y \in \mathcal{C}^A$ (3)

or, equivalently, such that for every $\alpha \in A$

$$f \upharpoonright \alpha \overset{\text{def}}{=} \{(x \upharpoonright \alpha, y \upharpoonright \alpha): (x, y) \in f\}$$

is a one-to-one function from $\mathcal{C}^{A \cap \alpha}$ into $\mathcal{C}^{A \cap \alpha}$. Functions $f$ from $\Phi_{\text{prism}}(A)$ were first introduced, in more general setting, in [19] where they are called projection-keeping homeomorphisms. Note that

$$\Phi_{\text{prism}}(A)$$

is closed under compositions (4)

and that for every ordinal number $\alpha > 0$

$$\text{if } f \in \Phi_{\text{prism}}(A) \text{ then } f \upharpoonright \alpha \in \Phi_{\text{prism}}(A \cap \alpha).$$

(5)

For $0 < \alpha < \omega_1$ let

$$\mathbb{P}_\alpha = \{\text{range}(f): f \in \Phi_{\text{prism}}(\alpha)\}.$$

Note that

$$\text{if } f \in \Phi_{\text{prism}}(\alpha) \text{ and } P \in \mathbb{P}_\alpha \text{ then } f[P] \in \mathbb{P}_\alpha.$$

(6)

Indeed, if $P = g[\mathcal{C}^\alpha]$ for some $g \in \Phi_{\text{prism}}(\alpha)$ then, by condition (4), we have $f[P] = f[g[\mathcal{C}^\alpha]] = (f \circ g)[\mathcal{C}^\alpha] \in \mathbb{P}_\alpha$.

We will write $\Phi_{\text{prism}}$ for $\bigcup_{0 < \alpha < \omega_1} \Phi_{\text{prism}}(\alpha)$ and define

$$\mathbb{P}_{\omega_1} \overset{\text{def}}{=} \bigcup_{0 < \alpha < \omega_1} \mathbb{P}_\alpha = \{\text{range}(f): f \in \Phi_{\text{prism}}\}.$$

Following [19] we will refer to elements of $\mathbb{P}_{\omega_1}$ as iterated perfect sets.

The simplest elements of $\mathbb{P}_{\omega_1}$ are cubes (in $\mathcal{C}^A$), that is, the sets of the form $C = \prod_{a \in A} C_a$, where $C_a \in \text{Perf}(\mathcal{C})$ for each $a \in A$. (This is justified by a function $f = \langle f_a \rangle_{a \in A} \in \Phi_{\text{prism}}(A)$, where each $f_a$ is a homeomorphism from $\mathcal{C}$ onto $C_a$.) In particular, since any open ball $B_\alpha(z, \varepsilon)$ (in the metric given by (1)) is a cube in $\mathcal{C}^\alpha$, it belongs to $\mathbb{P}_\alpha$. In fact, more can be said:

$$\text{if } \mathcal{B}_\alpha \overset{\text{def}}{=} \{B \subset \mathcal{C}^\alpha: B \text{ is clopen in } \mathcal{C}^\alpha\} \text{ then } \mathcal{B}_\alpha \subset \mathbb{P}_\alpha.$$  (7)
This is the case, since any clopen $E$ in $C^\alpha$ is a finite union of disjoint open balls, each of which belongs to $P_\alpha$, and it is easy to see that $P_\alpha$ is closed under finite unions of open balls.

In general, the structure of elements of $P_{\omega_1}$ can be considerably more complex. However, there is only one non-trivial fact about $P_{\omega_1}$ that we will use in this paper: the family $P_{\omega_1}$ satisfies the following fusion lemma.

**Lemma 2.1 (Fusion Lemma)** Let $0 < \alpha < \omega_1$, $A \in \{B_\alpha, P_\alpha\}$, and let $\langle D_k \subset [A]^{<\omega}; k < \omega \rangle$ be such that for every $k < \omega$ the following holds.

(P1) ($D_k$ is $A$-open) If $\{E_0, \ldots, E_n\} \in D_k$ and $E'_0, \ldots, E'_n \in A$ are such that $E'_i \subset E_i$ for every $i \leq n$ then $\{E'_0, \ldots, E'_n\} \in D_k$.

(P2) (sequence splits) If $\{E_0, \ldots, E_n\} \in D_k$ and $\{E^i_0, E^i_1\} \in D_{k+1}$ for every $i \leq n$ is such that $E^i_0 \cup E^i_1 \subset E_i$ then $\{E^i_j; i \leq n \& j < 2\} \in D_{k+1}$.

(P3) ($D_k$ is nicely $A$-dense) For every $E \in A$ and $\gamma < \alpha$ there are disjoint $E_0, E_1 \in A$ such that $E_0 \cup E_1 \subset E$, $\{E_0, E_1\} \in D_k$, and $\pi_\gamma[E_0] = \pi_\gamma[E_1]$.

Then there exists a sequence $\langle E_k \in D_k; k < \omega \rangle$ with the property that its fusion $Q = \bigcap_{k<\omega} \bigcup E_k$ belongs to $P_\alpha$.

Although the lemma looks quite complicated, it should be stressed that in all its application we will be checking only condition (P3), since the other two conditions will be trivially satisfied. The proof of Lemma 2.1 will be postponed till the end of this paper.

The only other fact we will use on $P_{\omega_1}$ (or, more precisely, on cubes) is the following

**Claim 2.2** If $G \subset C^\omega$ is comeager in $C^\omega$ then it contains a perfect cube $\prod_{i<\omega} P_i$.

**Proof.** It follows easily, by induction on coordinates, from the following well known fact.

For every comeager subset $H$ of $C \times C$ there are perfect set $P \subset C$ and a comeager subset $\hat{H}$ of $C$ such that $P \times \hat{H} \subset H$. 
To state CPA\textsubscript{prism} we need a few more definitions. For a fixed Polish space $X$ let $\mathcal{F}_{\text{prism}}(X)$ (or just $\mathcal{F}_{\text{prism}}$, if $X$ is clear from the context) be the family of all continuous injections $f : E \to X$, where $E \in \mathbb{P}_{\omega_1}$. Each such injection $f$ is called a \textit{prism} in $X$ and is considered as a coordinate system imposed on $P = \text{range}(f)$.ootnote{In a language of forcing a coordinate function $f$ is simply a nice name for an element from $X$.} We will usually abuse this terminology and refer to $P$ itself as a \textit{prism} (in $X$) and to $f$ as a \textit{witness function} for $P$. A function $g \in \mathcal{F}_{\text{prism}}$ is \textit{subprism} of $f$ provided $g \subset f$. In the above spirit we call $Q = \text{range}(g)$ a \textit{subprism} of a prism $P$. Thus, when we say that $Q$ a \textit{subprism} of a prism $P \in \text{Perf}(X)$ we mean that $Q = f[E]$, where $f$ is a witness function for $P$, $E \in \mathbb{P}_{\omega_1}$, and $E \subset \text{dom}(f)$. A family $\mathcal{E} \subset \text{Perf}(X)$ is $\mathcal{F}_{\text{prism}}$-\textit{dense} provided

$$\forall f \in \mathcal{F}_{\text{prism}} \exists g \in \mathcal{F}_{\text{prism}} (g \subset f \& \text{range}(g) \in \mathcal{E}).$$

Using (4) it is easy to show that

**Fact 2.3** $\mathcal{E} \subset \text{Perf}(X)$ is $\mathcal{F}_{\text{prism}}$-dense if and only if

$$\forall \alpha < \omega_1 \forall f \in \mathcal{F}_{\text{prism}}, f : \mathfrak{c}^\alpha \to X, \exists g \in \mathcal{F}_{\text{prism}} (g \subset f \& \text{range}(g) \in \mathcal{E}).$$

Thus, to establish $\mathcal{F}_{\text{prism}}$-density we can always assume that the witness function $f$ for the prism $P$ is in a \textit{standard form}, that is, defined on the entire set $\mathfrak{c}^\alpha$.

Now we are ready to state the axiom.

**CPA\textsubscript{prism}:** $c = \omega_2$ and for every Polish space $X$ and every $\mathcal{F}_{\text{prism}}$-dense family $\mathcal{E} \subset \text{Perf}(X)$ there is an $\mathcal{E}_0 \subset \mathcal{E}$ such that $|\mathcal{E}_0| \leq \omega_1$ and $|X \backslash \bigcup \mathcal{E}_0| \leq \omega_1$.

The proof of the consistency of CPA\textsubscript{prism} can be found in [12, Prop. 4.2]. (See also [13].) We finish this section with yet another lemma which will be used in our applications.

**Lemma 2.4** For every $0 < \alpha < \omega_1$, $E \in \mathbb{P}_\alpha$, a Polish space $X$, and a continuous function $f : E \to X$ there exist $0 < \beta \leq \alpha$ and $P \in \mathbb{P}_\alpha$, $P \subset E$, such that $f \circ \pi_{\beta}^{-1}$ is a function on $\pi_{\beta}[P] \in \mathbb{P}_\beta$ which is either one-to-one or constant.

Lemma 2.4 is a particular case of [19, Thm. 20]. It can be also easily deduced from Lemma 2.1. (See also [13, Lemma 3.2.5].)
3 Covering results and their discussion

The main consequence of CPA\textsubscript{prism} we discuss in this paper is the following theorem.

**Theorem 3.1** The following facts follow from CPA\textsubscript{prism}.

(a) For every Borel measurable function \( g: \mathbb{R} \to \mathbb{R} \) there exists a family of functions \( \{ f_\xi \in \text{"}C_\infty^{\text{perf}}\text{"}; \xi < \omega_1 \} \) such that
\[
g = \bigcup_{\xi < \omega_1} f_\xi.
\]
Moreover for each \( \xi < \omega_1 \) there exists an extension \( \bar{f}_\xi: \mathbb{R} \to \mathbb{R} \) of \( f_\xi \) such that

(i) \( \bar{f}_\xi \in \text{"}C^1\text{"} \) and

(ii) either \( \bar{f}_\xi \in C^1 \) or \( \bar{f}_\xi \) is a homeomorphism from \( \mathbb{R} \) onto \( \mathbb{R} \) such that \( \bar{f}_\xi^{-1} \in C^1 \).

(b) There exists a sequence \( \{ f_\xi \in \mathbb{R}^2; \xi < \omega_1 \} \) of \( C^1 \) functions such that
\[
\mathbb{R}^2 = \bigcup_{\xi < \omega_1} (f_\xi \cup f_\xi^{-1}).
\]

The essence of Theorem 3.1 lies in the following real analysis fact. Its proof is combinatorial in nature and uses no extra set-theoretical assumptions.

**Proposition 3.2** Let \( g: \mathbb{R} \to \mathbb{R} \) be Borel and \( 0 < \alpha < \omega_1 \).

(a) For every continuous injection \( h: \mathcal{C}^\alpha \to \mathbb{R} \) there exists an \( E \in \mathcal{P}_\alpha \) such that \( g \upharpoonright h[E] \in \text{"}C_\infty^{\text{perf}}\text{"} \) and there is an extension \( f: \mathbb{R} \to \mathbb{R} \) of \( g \upharpoonright h[E] \) such that \( f \in \text{"}C^1\text{"} \) and either \( f \in C^1 \) or \( f \) is a self-homeomorphism of \( \mathbb{R} \) with \( f^{-1} \in C^1 \).

(b) For every continuous injection \( h: \mathcal{C}^\alpha \to \mathbb{R}^2 \) there exists an \( E \in \mathcal{P}_\alpha \) such that either \( F = h[E] \subset \mathbb{R}^2 \) or its inverse, \( F^{-1} \), is a function which can be extended to a \( C^1 \) function \( f: \mathbb{R} \to \mathbb{R} \).
With Proposition 3.2 in hand the proof of Theorem 3.1 becomes an easy exercise.

**Proof of Theorem 3.1.** (a) Let \( g : \mathbb{R} \to \mathbb{R} \) be a Borel function and let \( \mathcal{E} \) be the family of all \( P \in \text{Perf}(\mathbb{R}) \) such that

\[
 g \upharpoonright P \in \mathcal{C}_\text{perf}^\infty \quad \text{and there is an extension } f : \mathbb{R} \to \mathbb{R} \text{ of } g \upharpoonright P \quad \text{such that } f \in \mathcal{C}^1 \quad \text{and either } f \in \mathcal{C}^1 \quad \text{or } f \text{ is a self-homeomorphism of } \mathbb{R} \text{ with } f^{-1} \in \mathcal{C}^1.
\]

By Proposition 3.2(a) family \( \mathcal{E} \) is \( \mathcal{F}_{\text{prism}} \)-dense: if \( P \in \text{Perf}(\mathbb{R}) \) is a prism and \( h : \mathcal{C}_\alpha \to \mathbb{R} \) from \( \mathcal{F}_{\text{prism}} \) witnesses it then \( Q = h[E] \) as in the proposition is a subprism of \( P \) with \( Q \in \mathcal{E} \). So, by CPA\_prism, there exists an \( \mathcal{E}_0 \in [\mathcal{E}]^{\leq \omega_1} \) such that \( |\mathbb{R} \setminus \bigcup \mathcal{E}_0| \leq \omega_1 \). Let \( \mathcal{E}_1 = \mathcal{E}_0 \cup \{\{r\} : r \in \mathbb{R} \setminus \bigcup \mathcal{E}_0\} \). Then the family \( \{g \upharpoonright P : P \in \mathcal{E}_1\} \) satisfies the theorem.

(b) Let \( \mathcal{E} \) be the family of all \( P \in \text{Perf}(\mathbb{R}^2) \) such that either \( P \) or \( P^{-1} \) is a function which can be extended to a \( \mathcal{C}^1 \) function \( f : \mathbb{R} \to \mathbb{R} \). By Proposition 3.2(b) family \( \mathcal{E} \) is \( \mathcal{F}_{\text{prism}} \)-dense, so there exists an \( \mathcal{E}_0 \in [\mathcal{E}]^{\leq \omega_1} \) such that \( |\mathbb{R} \setminus \bigcup \mathcal{E}_0| \leq \omega_1 \). Let \( \mathcal{E}_1 = \mathcal{E}_0 \cup \{\{x\} : x \in \mathbb{R}^2 \setminus \bigcup \mathcal{E}_0\} \). For every \( P \in \mathcal{E}_1 \) let \( f_P : \mathbb{R} \to \mathbb{R} \) be a \( \mathcal{C}^1 \) function which extends either \( P \) or \( P^{-1} \). Then family \( \{f_P : P \in \mathcal{E}_1\} \) is as desired.

The proof of Proposition 3.2 will be left to the next sections. Meanwhile we like to present a discussion of Theorem 3.1.

First we like to reformulate Theorem 3.1 in a language of a covering number \( \text{cov} \) defined below, where \( X \) is an infinite set (in our case \( X \subset \mathbb{R}^2 \) with \( |X| = c \)) and \( \mathcal{A}, \mathcal{F} \subset \mathcal{P}(X) \):

\[
\text{cov}(\mathcal{A}, \mathcal{F}) = \min \left( \left\{ \kappa : (\forall A \in \mathcal{A})(\exists G \in [\mathcal{F}]^{\leq \kappa}) A \subset \bigcup G \right\} \cup \{|X|^+\} \right).
\]

If \( A \subset X \) we will write \( \text{cov}(A, \mathcal{F}) \) for \( \text{cov}(\{A\}, \mathcal{F}) \). Notice the following monotonicity of \( \text{cov} \) operator: for every \( A \subset B \subset X \), \( \mathcal{A} \subset \mathcal{B} \subset \mathcal{P}(X) \), and \( \mathcal{F} \subset \mathcal{G} \subset \mathcal{P}(X) \)

\[
\text{cov}(\mathcal{A}, \mathcal{G}) \leq \text{cov}(\mathcal{B}, \mathcal{G}) \leq \text{cov}(\mathcal{B}, \mathcal{F}) \quad \& \quad \text{cov}(A, \mathcal{G}) \leq \text{cov}(B, \mathcal{G}) \leq \text{cov}(B, \mathcal{F}).
\]

In terms of the \( \text{cov} \) operator Theorem 3.1 can be expressed in the following form, where Borel stands for the class of all Borel functions \( f : \mathbb{R} \to \mathbb{R} \).
Corollary 3.3 CPA prism implies that

(a) $\text{cov} (\text{Borel}, \mathcal{C}_1) = \omega_1 < \mathfrak{c}$;
(b) $\text{cov} (\text{Borel}, \mathcal{C}_1) = \omega_1 < \mathfrak{c}$;
(c) $\text{cov} (\text{Borel}, \mathcal{C}_1 \cup (\mathcal{C}_1)^{-1}) = \omega_1 < \mathfrak{c}$;
(d) $\text{cov} (\mathbb{R}^2, \mathcal{C}_1 \cup (\mathcal{C}_1)^{-1}) = \omega_1 < \mathfrak{c}$.

Proof. The fact that all numbers $\text{cov}(\mathcal{A}, \mathcal{G})$ listed above are $\leq \omega_1$ follows directly from Theorem 3.1. The other inequalities follow from Examples 7.6 and 7.8.

Theorem 3.1(b) and Corollary 3.3(d) can be treated as generalizations of a result of Steprēns [26] who proved that in the iterated perfect set model we have $\text{cov} (\mathbb{R}^2, (\mathcal{D}_1) \cup (\mathcal{D}_1)^{-1}) \leq \omega_1$. This clearly follows from Corollary 3.3(d) since $\mathcal{C}_1 \subsetneq \mathcal{D}_1$. (See survey article [4]. For more information how to “locate” Steprēns’ result in [26] see also [11, Cor. 9].)

The following proposition shows that Theorem 3.1 is, in a way, the best possible. (Parts (i), (ii), and (iii) relate, respectively, to items (b), (c)&(d), and (a) from Corollary 3.3.)

Proposition 3.4 The following is true in ZFC.

(i) $\text{cov} (\text{Borel}, \mathcal{C}_1) = \text{cov} (\mathcal{C}_1, \mathcal{C}_1) = \text{cov} (\mathcal{C}_1, \mathcal{D}_1^{\text{perf}}) = \mathfrak{c}$. Moreover, $\text{cov} (\mathcal{C}_n, \mathcal{C}_n) = \text{cov} (\mathcal{C}_n, \mathcal{D}_n^{\text{perf}}) = \mathfrak{c}$ for every $0 < n < \omega$.

(ii) $\text{cov} (\text{Borel}, \mathcal{C}_2 \cup (\mathcal{C}_2)^{-1}) = \text{cov} (\mathcal{C}_2, \mathcal{D}_2^{\text{perf}} \cup (\mathcal{D}_2^{\text{perf}})^{-1}) = \mathfrak{c}$, and $\text{cov} (\mathbb{R}^2, \mathcal{C}_2 \cup (\mathcal{C}_2)^{-1}) = \text{cov} (\mathcal{C}_2, \mathcal{D}_2^{\text{perf}} \cup (\mathcal{D}_2^{\text{perf}})^{-1}) = \mathfrak{c}$.

(iii) $\text{cov} (\text{Borel}, \mathcal{C}_1^{\text{perf}}) = \text{cov} (\mathcal{C}_1^{\text{perf}}, \mathcal{C}_1^{\text{perf}}) = \text{cov} (\mathcal{C}_1^{\text{perf}}, \mathcal{C}_1^{\text{perf}}) = \mathfrak{c}$, and $\text{cov} (\text{Borel}, \mathcal{C}_1^{\text{inf}}) = \text{cov} (\mathcal{C}_1^{\text{inf}}, \mathcal{C}_1^{\text{inf}}) = \text{cov} (\mathcal{C}_1^{\text{inf}}, \mathcal{C}_1^{\text{inf}}) = \mathfrak{c}$. Moreover, $\text{cov} (\mathcal{C}_n, \mathcal{D}_n^{n+1}) = \mathfrak{c}$ for every $0 < n < \omega$.

Proof. (i) follows immediately from Examples 7.2 and 7.3.

(ii) follows from monotonicity of cov operator and Example 7.1.

The first part of (iii) follows from (i). The remaining two parts follow, respectively, from Examples 7.4 and 7.5.
Corollary 3.3 and Proposition 3.4 establish the values of cov operator for all classes in Chart 1 except for cov \((D^n, C^n)\) and cov \("D^n", "C^n"\). These are established in the following theorem, which proof will be left to Sections 6.

**Theorem 3.5** If CPA\(_{\text{prism}}\) holds then for every \(0 < n < \omega\)

\[
\text{cov}(D^n, C^n) = \text{cov} ("D^n", "C^n") = \omega_1 < \mathfrak{c}.
\]

With this theorem in hand we can summarize the values of the cov operator between the classes from Chart 1 in the following graphical form. Here the mark “\(\mathfrak{c}\)” next to the arrow means that the covering of the larger class by the functions from the smaller class is equal to \(\mathfrak{c}\) and that this can be proved in ZFC. The mark “\(< \mathfrak{c}\)” next to the arrow means that it is consistent with ZFC (and it follows from CPA\(_{\text{prism}}\)) that the appropriate cov number is \(< \mathfrak{c}\). (From Examples 7.6, 7.7, and 7.8 it follows that all these numbers are greater than or equal to \(\min\{\text{cov}(\mathcal{M}), \text{cov}(\mathcal{N})\} > \omega\). So under the continuum hypothesis CH or Martin’s Axiom MA all these numbers are equal to \(\mathfrak{c}\).)

\[
\begin{array}{cccc}
D^1 & \nearrow_{\mathfrak{c}} & C^1 & \nearrow_{\mathfrak{c}} \\
| & \mathrm{c} & \mathrm{c} & |
\end{array}
\begin{array}{cccc}
D^{n+1} & \nearrow_{\mathfrak{c}} & C^{n+1}
\end{array}
\]

\[
\begin{array}{cccc}
C^0 & \nearrow_{\mathfrak{c}} & "D^1" & \nearrow_{\mathfrak{c}} & "C^1" & \nearrow_{\mathfrak{c}}
\end{array}
\begin{array}{cccc}
C^n & \nearrow_{\mathfrak{c}} & "D^{n+1}" & \nearrow_{\mathfrak{c}} & "C^{n+1}"
\end{array}
\]

Chart 2. Values of cov operator: for \(n = 0\) (left) and \(n > 0\) (right).

The values of cov next the vertical arrows are justified by \(\text{cov}("C^n", D^n) = \mathfrak{c}\) (Proposition 3.4(i)), while marks “\(< \mathfrak{c}\)” below the upper horizontal arrows and that directly below them follow from Theorem 3.5. The remaining arrow of the right part of the chart is the restatement of the last part of Proposition 3.4(iii), while its counterpart in the left part of the chart follows from Corollary 3.3(b): \(\text{cov}(\mathcal{C}, "C^n") = \text{cov} (\text{Borel}, "C^n") < \mathfrak{c}\) is a consequence of CPA\(_{\text{prism}}\). Finally let us mention that in Corollary 3.3(b) there is no chance to increase family Borel in any essential way and keep the result. This follows from the following fact

\[
\text{cov}(\mathcal{S}, \mathcal{C}) = \text{cov} (\mathbb{R}^\mathbb{R}, \mathcal{C}) \geq \text{cof}(\mathfrak{c}), \quad (8)
\]
where symbol $S_{\text{c}}$ stands for the family of all symmetrically continuous functions $f: \mathbb{R} \to \mathbb{R}$ which are, in particular, continuous outside of some set of measure zero and first category. (See [10, Cor. 1.1] and the remarks below on the operator $\text{dec}$.)

Number $\text{cov}(\mathcal{A}, \mathcal{F})$ is very closely related to the following decomposition number

$$\text{dec}(\mathcal{A}, \mathcal{F}) = \min\left\{ \kappa \geq \omega : (\forall A \in \mathcal{A}) (\exists \text{ a partition } \mathcal{G} \in [\mathcal{F}]^\kappa \text{ of } A) \cup \{|X|^+\} \right\}$$

which was first studied by Cichoń, Morayne, Pawlikowski, and Solecki [7] for the Baire class $\alpha$ functions. (More information on $\text{dec}(\mathcal{F}, \mathcal{G})$ can be found in a survey article [8, sec. 4].) It is easy to see that if $\mathcal{A}$ and $\mathcal{F}$ are some classes of partial functions and $\mathcal{F}_r$ denotes all possible restrictions of functions from $\mathcal{F}$ then $\text{cov}(\mathcal{A}, \mathcal{F}) = \text{dec}(\mathcal{A}, \mathcal{F}_r)$. In particular, for all situations relevant to our discussion above the operators $\text{cov}$ and $\text{dec}$ have the same values.

Our number $\text{cov}$ is also related to the following general class of problems. We say that the families $\mathcal{A}, \mathcal{F} \subset \mathcal{P}(X)$ satisfy Intersection Theorem, which we denote by

$$\text{IntTh}(\mathcal{A}, \mathcal{F}),$$

if for every $A \in \mathcal{A}$ there exists an $F \in \mathcal{G}$ such that $|A \cap F| = |X|$. If $\mathcal{A} = \{A\}$ we will write $\text{IntTh}(A, \mathcal{F})$ in place of $\text{IntTh}(\mathcal{A}, \mathcal{F})$. This kind of theorems have been studied for a big part of this century. In particular, in early 1940’s Ulam asked in the Scottish Book [21, Problem 17.1] if $\text{IntTh}(\mathcal{C}, \text{Analytic})$ holds, that is, whether for every $f \in \mathcal{C}$ there exists a real analytic function $g: \mathbb{R} \to \mathbb{R}$ which agrees with $f$ on a perfect set. (See [27].) In 1947 Zahorski [29] gave a negative answer to this question by proving that the proposition $\text{IntTh}(\mathcal{C}^\infty, \text{Analytic})$ is false. In the same paper he also raised a natural question, which has become known as Ulam-Zahorski Problem: Does $\text{IntTh}(\mathcal{C}, \mathcal{G})$ hold for $\mathcal{G} = \mathcal{C}^\infty$ (or $\mathcal{G} = \mathcal{C}^n$ or $\mathcal{G} = D^n$)? Here is a quick summary of what is known on this problem. (See [4].)

**Proposition 3.6**

(a) (Zahorski [29]) $\neg\text{IntTh}(\mathcal{C}^\infty, \text{Analytic}).$

(b) (Agronsky, Bruckner, Laczkovich, Preiss [1]) $\text{IntTh}(\mathcal{C}, \mathcal{C}^1).$

(c) (Olevskii [24]) $\text{IntTh}(\mathcal{C}^1, \mathcal{C}^2).$

(d) (Olevskii [24]) $\neg\text{IntTh}(\mathcal{C}, \mathcal{C}^2)$ and $\neg\text{IntTh}(\mathcal{C}^n, \mathcal{C}^{n+1})$ for $n \geq 2$. 
We are interested in these problems since for the families \( A, F \in \mathcal{P}(\mathbb{R}^n) \) of uncountable Borel sets
\[
\neg \text{IntTh}(A, F) \implies \text{cov}(A, F) = \mathfrak{c}
\]  
(9)
as, in this situation, if \( \neg \text{IntTh}(A, F) \) then there exists an \( A \in A, |A| = \mathfrak{c} \), such that \( |A \cap F| \leq \omega \) for every \( F \in \mathcal{F} \). Thus in the examples relevant to Proposition 3.4 instead of proving \( \text{cov}(A, F) = \mathfrak{c} \) we will be in fact showing a stronger fact that \( \neg \text{IntTh}(A_0, F) \) for appropriate \( A_0 \subset A \in A \).

4 Proof of Proposition 3.2

Proposition 3.2 will be deduced from the following fact, which is a generalization of a theorem of Morayne [23]. (Morayne proved his results for \( E \) and \( E_1 \) being perfect sets, that is, for \( \alpha = 1 \).) For a set \( X \) we will use symbol \( \Delta_X \) to denote the diagonal in \( X \times X \), that is, \( \Delta_X = \{ \langle x, x \rangle : x \in X \} \). We will usually write simply \( \Delta \) in place of \( \Delta_X \), since \( X \) is always clear from the context.

Proposition 4.1

Let \( 0 < \alpha < \omega_1, E \in \mathbb{P}_\alpha, h: E \to \mathbb{R} \) be a continuous injection, and \( G \) be a function from \( (h[E])^2 \setminus \Delta \) into \([0, 1]\) which is continuous and symmetric, that is, such that \( G(x, y) = G(y, x) \) for all \( x, y \in (h[E])^2 \setminus \Delta \). Then there exists an \( E_1 \in \mathbb{P}_\alpha, E_1 \subset E \), such that \( G \) is uniformly continuous on \( (h[E_1])^2 \setminus \Delta \).

The proof of Proposition 4.1 will be presented in the next section. In the proof of Proposition 3.2 we will also use the following lemma.

Lemma 4.2

Let \( g: \mathbb{R} \to \mathbb{R} \) be Borel, \( 0 < \alpha < \omega_1 \), and \( E \in \mathbb{P}_\alpha \). For every continuous injection \( h: E \to \mathbb{R} \) there exist subset \( E_1 \in \mathbb{P}_\alpha \) of \( E \) and a “\( \mathcal{C}^1 \)” function \( f: \mathbb{R} \to \mathbb{R} \) such that \( f \) extends \( g \upharpoonright h[E_1] \).

In addition we can require that either \( f \in \mathcal{C}^1 \) or

\[ (*) \quad f' \upharpoonright h[E_1] \text{ is constant equal to } \infty \text{ or } -\infty \text{ and } f \text{ is a self-homeomorphism of } \mathbb{R} \text{ such that } f^{-1} \in \mathcal{C}^1. \]

PROOF. First note that there exists an \( E' \in \mathbb{P}_\alpha, E' \subset E \), such that \( g \upharpoonright h[E'] \) is continuous.  
(10)
Indeed, let \( h_0 \in \Phi_{\text{prism}} \) be such that \( E = h_0[\mathcal{C}^\alpha] \) and let \( U \) be a comeager subset of \( h[E] = (h \circ h_0)[\mathcal{C}^\alpha] \) such that the restriction \( g \upharpoonright U \) is continuous. Then \( (h \circ h_0)^{-1}(U) \) is comeager in \( \mathcal{C}^\alpha \) and, by Claim 2.2, there is a perfect cube \( Q \subset (h \circ h_0)^{-1}(U) \). The set \( E' = h_0[Q] \in \mathbb{P}_\alpha \) has the desired property since \( h[E'] = h[h_0[Q]] \subset U \).

Now let \( k: [-\infty, \infty] \to [0, 1] \) be a homeomorphism and let \( G \) be defined on \( (h[E'])^2 \setminus \Delta \) by

\[
G(x, y) = k \left( \frac{g(x) - g(y)}{x - y} \right).
\]

Then, by Proposition 4.1, there exists an \( E'_1 \in \mathbb{P}_\alpha, E'_1 \subset E' \), such that \( G \) is uniformly continuous on \( (h[E'])^2 \setminus \Delta \). So, there exists a uniformly continuous extension of \( G \upharpoonright (h[E'])^2 \setminus \Delta \) to \( \hat{G} \upharpoonright (h[E'])^2 \). Clearly \( k^{-1}(\hat{G}(x, x)) \) is the derivative (possibly infinite) of \( g_0 = g \upharpoonright h[E'_1] \) for every \( x \in h[E'_1] \), so \( g_0 \in \mathcal{C}^1(h[E'_1]) \).

Now, if \( (g'_0)^{-1}(\mathbb{R}) \) is non-empty then, as in the argument for (10), we can find an \( E_1 \in \mathbb{P}_\alpha, E_1 \subset E'_1 \), such that \( h[E_1] \subset (g'_0)^{-1}(\mathbb{R}) \). This obviously implies \( g \upharpoonright h[E_1] \in \mathcal{C}^1_{\text{perf}} \). But we also know that the difference quotient function \( \frac{g(x) - g(y)}{x - y} \) is uniformly continuous on \( (h[E_1])^2 \setminus \Delta \). So, by Whitney’s extension theorem [28] (see also Lemma 6.1), we can find a \( \mathcal{C}^1 \) extension \( f: \mathbb{R} \to \mathbb{R} \) of \( g \upharpoonright h[E_1] \).

So, assume that \( (g'_0)^{-1}(\mathbb{R}) = \emptyset \). Then either \( (g'_0)^{-1}(\infty) \) or \( (g'_0)^{-1}(-\infty) \) is non-empty and open in \( h[E'_1] \). Assume the former case. Similarly as above we can find an \( E''_1 \in \mathbb{P}_\alpha, E''_1 \subset E'_1 \), such that \( g'_0[h[E''_1]] = \{ \infty \} \). Then, by a version of Whitney’s extension theorem from [3, Thm. 2.1], we can find a “\( \mathcal{C}^1 \)” extension \( f_0: \mathbb{R} \to \mathbb{R} \) of \( g \upharpoonright h[E''_1] \).

But then there exists an open interval \( J \) in \( \mathbb{R} \) intersecting \( h[E''_1] \) on the closure of which \( f'_0 \) is positive. So \( f_1 = f_0 \upharpoonright \text{cl}(J) \) is strictly increasing and the derivative of \( f_1^{-1} \) is continuous, non-negative, and bounded. Thus there exists a homeomorphism \( f_2: \mathbb{R} \to \mathbb{R} \) extending \( f_1^{-1} \) with \( f_2 \in \mathcal{C}^1 \). Now put \( f = f_2^{-1} \) and take an \( E_1 \in \mathbb{P}_\alpha \) with \( E_1 \subset E''_1 \cap h^{-1}(J) \). It is easy to see that \( E_1 \) and \( f \) are as required.

**Proof of Proposition 3.2(a).** By Lemma 4.2 we can find an \( E_0 \in \mathbb{P}_\alpha \) for which there is an extension \( f: \mathbb{R} \to \mathbb{R} \) of \( g \upharpoonright h[E_0] \) such that \( f \in \mathcal{C}^1 \) and either \( f \in \mathcal{C}^1 \) or \( f \) is a self-homeomorphism of \( \mathbb{R} \) with \( f^{-1} \in \mathcal{C}^1 \). Thus, it is enough to find a subset \( E \in \mathbb{P}_\alpha \) of \( E_0 \) for which \( g \upharpoonright h[E] \in \mathcal{C}^\infty_{\text{perf}} \).
If there exist a subset $E \in \mathbb{P}_\alpha$ of $E_0$ and $n < \omega$ such that

$$f = g \upharpoonright h[E] \in \"C_{\text{perf}}^{n}\"$$

and $f^{(n)}$ has a constant value $\infty$ or $-\infty$ \hfill (11)

then this $E$ is as desired. So assume that there is no such $E$. We will use Fusion Lemma 2.1 with $\mathcal{A} = \mathbb{P}_\alpha$ to find a subprism $E$ of $E_0$ for which $g \upharpoonright h[E] \in \mathcal{C}_{\text{perf}}^\infty$.

First notice that we can assume that $E_0 = \mathcal{C}^\alpha$, since we can replace $h$ with $h \circ h_0$, where $h_0 \in \Phi_{\text{prism}}$ is such that $E_0 = h_0 \mathcal{C}^\alpha$. For $k < \omega$ let $\mathcal{D}_k \subset \mathbb{P}_\alpha^{<\omega}$ be the collection of all finite families $\mathcal{E}$ of pairwise disjoint sets each of the diameter less than $2^{-k}$ such that

$$g \upharpoonright \bigcup \{h[E] : E \in \mathcal{E}\} \in \mathcal{C}_{\text{perf}}^k. \hfill (12)$$

We need to show that $\mathcal{D}_k$'s satisfy the assumptions of Lemma 2.1.

It is obvious that the conditions (P1) and (P2) are satisfied. To see that (P3) holds for $k < \omega$ fix $F \in \mathbb{P}_\alpha$ and $\gamma < \alpha$. Applying Lemma 4.2 $k$-times and using the fact that (11) is false we can find a sequence $F = P_0 \supset \cdots \supset P_k$ from $\mathbb{P}_\alpha$ such that $g \upharpoonright h[P_i] \in \mathcal{C}_{\text{perf}}^i$ for each $i < k$. Take disjoint $E_0, E_1 \in \mathbb{P}_\alpha$ subsets of $P_k$, each of diameter less than $2^{-k}$, such that $\pi_\gamma[E_0] = \pi_\gamma[E_1]$. It is easy to see that $E_0$ and $E_1$ satisfy the requirements of the condition (P3).

Now, by Lemma 2.1, there exist $\mathcal{E}_k \in \mathcal{D}_k$ such that $E = \bigcap_{k<\omega} \bigcup \mathcal{E}_k \in \mathbb{P}_\alpha$. Clearly $g \upharpoonright h[E] \in \mathcal{C}_{\text{perf}}^\infty$ for such an $E$. \hfill \blacksquare

**Proof of Proposition 3.2(b).** Let $\pi_x$ and $\pi_y$ be the projections of $\mathbb{R}^2$ onto $x$-axis and $y$-axis, respectively, and consider functions $h_x = \pi_x \circ h$ and $h_y = \pi_y \circ h$. Applying Lemma 2.4 two times we can find $\beta_x, \beta_y \leq \alpha$ and $E = P_y \subset P_x$ from $\mathbb{P}_\alpha$ such that $h_x \circ \pi_{\beta_x}^{-1}$ is a function on $\pi_{\beta_x}[P_x] \in \mathbb{P}_{\beta_x}$, $h_y \circ \pi_{\beta_y}^{-1}$ is a function on $\pi_{\beta_y}[P_y] \in \mathbb{P}_{\beta_y}$, and each of these functions is either one-to-one or constant. Notice that

either $h_x$ or $h_y$ is one-to-one on $E$. \hfill (13)

To see this first note that for every $z \in E$ we have

$$h(z) = (\pi_x \circ h(z), \pi_y \circ h(z)) = ((h_x \circ \pi_{\beta_x}^{-1})(\pi_{\beta_x}(z)), (h_y \circ \pi_{\beta_y}^{-1})(\pi_{\beta_y}(z))).$$

Since $h$ is one-to-one this implies that $\max\{\beta_x, \beta_y\} = \alpha$. By symmetry, we can assume that $\alpha = \beta_x$. Thus, $h_x = h_x \circ \pi_{\beta_x}^{-1}$ is either one-to-one or constant on $P_x = \pi_{\beta_x}[P_x]$. If $h_x$ is one-to-one on $P_x$ then (13) holds. So, assume that
$h_x$ is constant on $P_x$. Then $\pi_x \circ h = h_x$ is constant on $E \subset P_x$, and so $h_y = \pi_y \circ h$ must be one-to-one on $E$, since $h$ is one-to-one. Thus, (13) holds.

By symmetry, we can assume that $h_x$ is one-to-one on $E$. So $\pi_x \circ h$ is a one-to-one function from $E$ onto $\pi_x[h(E)] \subset \mathbb{R}$. In particular, $F_0 = h[E] \subset \mathbb{R}^2$ is a function from $\pi_x[h(E)]$ into $\mathbb{R}$. Then, by Lemma 4.2 used with $g = F_0$ and $h = \pi_x \circ h \mid E$, we can find a subset $E_1 \in \mathbb{P}_\alpha$ of $E$ and a function $f: \mathbb{R} \to \mathbb{R}$ extending $h[E_1] = g \mid h[E_1]$ such that either $f$ or $f^{-1}$ belongs to $C^1$.

\section{Proposition 4.1: a generalization of a theorem of Morayne}

Our proof of Proposition 4.1 is based on the following lemmas, the first of which is a version of a theorem of Galvin [16, 17]. (For the proof see [20, Thm. 19.7] or [6]. Galvin proved his results for $\alpha = 1$.)

\begin{lemma}
For every $0 < \alpha < \omega_1$ and every continuous symmetric function $h$ from $(\mathcal{C}^\alpha)^2 \setminus \Delta$ into $2 = \{0, 1\}$ there exists a $P \in \mathbb{P}_\alpha$ such that $h$ is constant on $P^2 \setminus \Delta$.
\end{lemma}

\textbf{Proof.} For $j < 2$ let $G_j$ be the set of all $s \in \mathcal{C}^\alpha$ such that

$$(\forall \beta < \alpha)(\forall \varepsilon > 0)(\exists t \in \mathcal{C}^\alpha) 0 < \rho(s, t) < \varepsilon \& s \upharpoonright \beta = t \upharpoonright \beta \& h(s, t) = j$$

and notice that

each $G_j$ is a $G_\delta$-set \quad and $\quad \mathcal{C}^\alpha = G_0 \cup G_1$. \quad \quad (14)

Indeed, to see that $G_j$ is a $G_\delta$-set it is enough to note that for every $\beta < \alpha$ and $\varepsilon > 0$ the set

$G_j^{\beta, \varepsilon} = \{s \in \mathcal{C}^\alpha: (\exists t \in \mathcal{C}^\alpha) 0 < \rho(s, t) < \varepsilon \& s \upharpoonright \beta = t \upharpoonright \beta \& h(s, t) = j\}$

is open in $\mathcal{C}^\alpha$. So let $s \in G_j^{\beta, \varepsilon}$ and take $t \in \mathcal{C}^\alpha$ witnessing it, that is, such that $0 < \rho(s, t) < \varepsilon$, $s \upharpoonright \beta = t \upharpoonright \beta$, and $h(s, t) = j$. We can choose basic open neighborhoods $U$ and $V$ of $s$ and $t$, respectively, such that $U \times V \setminus \Delta \subset h^{-1}(j)$. In addition we can assume that $\pi_\beta[U] = \pi_\beta[V]$ and that each of the sets $U$ and $V$ has diameter less than $\delta = (\varepsilon - \rho(s, t))/3$. Then $s \in U \subset G_i^{\beta, \varepsilon}$ since
for every $s' \in U$ there exists a $t' \in V$, $t' \neq s'$, with $s' \upharpoonright \beta = t' \upharpoonright \beta$ (since $\pi_{\beta}[U] = \pi_{\beta}[V]$), $h(s',t') \in h[U \times V \setminus \Delta] = \{j\}$ and

$$0 < \rho(s',t') \leq \rho(s',s) + \rho(s,t) + \rho(t,t') \leq \delta + \rho(s,t) + \delta < \varepsilon.$$ 

Thus each $G^{\beta,s}_j$ is open and $G_j$ is a $G_\delta$-set.

To see the second part of (14) assume, by way of contradiction, that there exists an $s \in C^\alpha \setminus (G_0 \cup G_1)$. Let $\beta_0, \varepsilon_0$ and $\beta_1, \varepsilon_1$ witness that $s \notin G_0$ and $s \notin G_1$, respectively. Put $\varepsilon = \min\{\varepsilon_0, \varepsilon_1\} > 0$ and $\beta = \max\{\beta_0, \beta_1\} < \alpha$ and find $t \in C^\alpha$ such that $t \upharpoonright \beta = s \upharpoonright \beta$, $\rho(s,t) < \varepsilon$, and $t(\beta) \neq s(\beta)$. Then there exists a $j < 2$ such that $h(s,t) = j$ and this, together with $t \upharpoonright \beta = s \upharpoonright \beta_j$ and $\rho(s,t) < \varepsilon_j$ contradicts the choice of $\beta_j$ and $\varepsilon_j$. This finishes the proof of (14).

Next find a $j < 2$ and a basic clopen set $U$ in $C^\alpha$ such that $G_j$ is residual in $U$. Replacing $C^\alpha$ with $U$, if necessary, we can assume that $G_j$ is residual in $C^\alpha$. Using Fusion Lemma 2.1 with $A = B_\alpha$ we will find a $P \in \mathcal{P}_\alpha$ for which $P^2 \setminus \Delta \subset h^{-1}(j)$.

For each $k < \omega$ let $\mathcal{D}_k \subset [B_\alpha]^{<\omega}$ be the collection of all families $\{P_i : i < m\}$ of sets of the diameter less than $2^{-k}$ such that

$$P_i \times P_n \subset h^{-1}(j) \text{ for all } i < n < m. \quad (15)$$

It is obvious $\mathcal{D}_k$’s satisfy conditions (P1) and (P2) from Lemma 2.1. Thus, we need only to check (P3).

So, take $E \in B_\alpha$ and $\gamma < \alpha$. It is enough to find disjoint $E_0, E_1 \in B_\alpha$ subsets of $E$ such that $\pi_\gamma[E_0] = \pi_\gamma[E_1]$ and

$$E_0 \times E_1 \subset h^{-1}(j). \quad (16)$$

For this choose an $s \in E \cap G_j$ and let $\varepsilon_0 > 0$ be such that $B_\alpha(s,\varepsilon_0) \subset E$. By the definition of $G_j$ we can find a $t \in C^\alpha$ for which $0 < \rho(s,t) < \varepsilon_0$, $s \upharpoonright \gamma = t \upharpoonright \gamma$, and $h(s,t) = j$. In particular $s, t \in E$ and $\langle s, t \rangle \in h^{-1}(j)$. Since $h$ is continuous we can find an $\varepsilon > 0$ small enough that $E_0 = B_\alpha(s,\varepsilon)$ and $E_1 = B_\alpha(t,\varepsilon)$ are disjoint subsets of $E$ for which (16) holds.

Now, by Lemma 2.1, there exist $\mathcal{E}_k = \{P^k_i : i < m_k\} \in \mathcal{D}_k$ such that $P = \bigcap_{k<\omega} \bigcup_{i<m_k} P^k_i \in \mathcal{P}_\alpha$. It is enough to show that $P^2 \setminus \Delta \subset h^{-1}(j)$. To see this, take different $s, t \in P$ and let $k < \omega$ be such that the distance between $s$ and $t$ is greater than $2^{-k}$. Then they must belong to different $P^k_i$’s from $\mathcal{E}_k$ and so, by (15), $\langle s, t \rangle \in h^{-1}(j)$.

We will also need the following simple fact, which must be well known.
Lemma 5.2 There exists a continuous function \( h : \mathcal{C} \to [0, 1] \) with the following property. If \( X \) is a zero-dimensional Polish space then for every continuous function \( f : X \to [0, 1] \) there exists a continuous \( g : X \to \mathcal{C} \) such that \( f = h \circ g \).

Proof. Let \( \{ U_{\sigma} : \sigma \in 2^{<\omega} \} \) be an open basis for \([0, 1]\) such that \( U_{\emptyset} = [0, 1] \) and, for every \( \sigma \in 2^k \), \( U_{\sigma} = U_{\sigma 0} \cup U_{\sigma 1} \) and \( \text{diam}(U_{\sigma}) \leq 2^{1-k} \). For every \( s \in 2^\omega \) let \( h(s) \in [0, 1] \) be such that \( \{ h(s) \} = \bigcap_{n<\omega} \text{cl}(U_{s|n}) \). It is clear that \( h \) is continuous.

To see that \( h \) is as required take \( X \) and \( f \) as in the lemma. For every \( \sigma \in 2^{<\omega} \) choose an open set \( V_{\sigma} \subset f^{-1}(U_{\sigma}) \) such that \( V_{\emptyset} = X \), \( V_{\sigma 0} \) and \( V_{\sigma 1} \) are disjoint, and \( V_{\sigma 0} \cup V_{\sigma 1} = V_{\sigma} \). This can be easily done by induction on the length of \( \sigma \) using zero-dimensionality of \( X \).\(^2\) Thus for every \( n < \omega \) the sets \( \{ V_{\sigma} : \sigma \in 2^n \} \) form a clopen partition of \( X \).

Define \( g(x) \) as the unique \( s \in \mathcal{C} \) for which \( x \in \bigcap_{n<\omega} V_{s|n} \). Clearly \( g \) is continuous. Moreover, if \( g(x) = s \) then

\[
x \in \bigcap_{n<\omega} V_{s|n} \subset f^{-1} \left( \bigcap_{n<\omega} \text{cl}(U_{s|n}) \right) = f^{-1}(\{ h(s) \}) = f^{-1}(\{ h(g(x)) \})
\]

so that \( f(x) \in \{ h(g(x)) \} \). Hence \( f = h \circ g \). \( \blacksquare \)

The next lemma is already a very close approximation of Proposition 4.1.

Lemma 5.3 If \( \alpha < \omega_1 \) and \( H \) is a continuous symmetric function from a set \((\mathcal{C}^\alpha)^2 \setminus \Delta\) into \( \mathcal{C} \) then there exists an \( E \in \mathbb{P}_\alpha \) such that \( H \) is uniformly continuous on \( E^2 \setminus \Delta \).

Proof. For \( n < \omega \) define \( h_n : (\mathcal{C}^\alpha)^2 \setminus \Delta \to 2 \) by \( h_n(s, t) = H(s, t)(n) \). Thus each \( h_n \) satisfies the assumptions of Lemma 5.1.

Using Fusion Lemma 2.1 with \( \mathcal{A} = \mathbb{P}_\alpha \) we will find an \( E \in \mathbb{P}_\alpha \) for which each \( h_n \) is uniformly continuous on \( E^2 \setminus \Delta \). Then clearly \( H = \langle h_n : n < \omega \rangle \) is also uniformly continuous on this set.

For \( k < \omega \) let \( D_k \subset [\mathbb{P}_\alpha]^{<\omega} \) be the collection of all families \( \{ P_i : i < m \} \) of pairwise disjoint sets such that

\[
h_k \text{ is constant on } P_i \times P_i \setminus \Delta \text{ for each } i < m\]  \( \tag{17} \)

\(^2\)Recall that every second countable zero-dimensional space \( X \) is strongly zero-dimensional, see e.g. [18, Thm. 6.2.7]. In particular, for every open cover \( \{ W_0, W_1 \} \) of \( X \) there are disjoint clopen sets \( V_0 \subset W_0 \) and \( V_1 \subset W_1 \) such that \( V_0 \cup V_1 = X \).
for some continuous symmetric function from $H = E 	imes E$. Then

so that

Let $f \in \Phi_{\text{prism}}(\alpha)$ be such that $E = f [\mathcal{C}^\alpha]$ and let $h: (\mathcal{C}^\alpha)^2 \setminus \Delta \to 2$ be defined by $h(s, t) = h_k(f(s), f(t))$. Then $h$ satisfies the assumptions of Lemma 5.1 so there exists a $P \in \mathbb{P}_\alpha$ such that $h$ is constant on $P^2 \setminus \Delta$. Choose disjoint subsets $E_0, E_1 \in \mathbb{P}_\alpha$ of $P$ such that $\pi_\gamma[E_0] = \pi_\gamma[E_1]$. (If $g \in \Phi_{\text{prism}}(\alpha)$ is such that $P = f [\mathcal{C}^\alpha]$ and $B_i = \{ x \in \mathcal{C}^\alpha : x(\gamma)(0) = i \}$ then we can put $E_i = g[B_i]$.) Then $E_0$ and $E_1$ satisfy (P3).

Now, by Lemma 2.1, there exist $\mathcal{E}_k = \{ P_i^k : i < m_k \} \in \mathcal{D}_k$ such that $E = \bigcap_{k<\omega} \bigcup_{i<m_k} P_i^k \in \mathbb{P}_\alpha$. Notice that if $\{ P_i^k : i < m_k \}$ belongs to $\mathcal{D}_k$ then $h_k$ is uniformly continuous on

So each $h_k$ is uniformly continuous $E^2 \setminus \Delta \subset (\bigcup_{i<m_k} P_i^k)^2 \setminus \Delta$.

**Proof of Proposition 4.1.** Let $f_0 \in \Phi_{\text{prism}}(\alpha)$ be such that $E = f_0 [\mathcal{C}^\alpha]$ and put

$$F = G \circ (h \circ f_0, h \circ f_0) : (\mathcal{C}^\alpha)^2 \setminus \Delta \to [0, 1].$$

Note also that

$$F = h_0 \circ H$$

for some continuous symmetric function from $H: (\mathcal{C}^\alpha)^2 \setminus \Delta \to \mathcal{C}$ and continuous $h_0: \mathcal{C} \to [0, 1]$. This follows immediately from Lemma 5.2 used with $f = F \upharpoonright \{ \langle x, y \rangle \in \mathcal{C}^\alpha \times \mathcal{C}^\alpha : x < y \}$, where $<$ is the lexicographical order on $\mathcal{C}^\alpha$. (We use the lexicographical order in which $\mathcal{C}^\alpha$ is identified with $2^{\alpha \times \omega}$ and $\alpha \times \omega$ is ordered in type $\omega$. Then the set $\{ \langle x, y \rangle \in \mathcal{C}^\alpha \times \mathcal{C}^\alpha : x < y \}$ is open in $\mathcal{C}^\alpha \times \mathcal{C}^\alpha$.)

Now, by Lemma 5.3, then there exists an $E_0 \in \mathbb{P}_\alpha$ such that $H$ is uniformly continuous on $(E_0)^2 \setminus \Delta$. So $H$ can be extended to a uniformly continuous function $\hat{H}$ on $(E_0)^2$. Then function

$$\hat{G} = h_0 \circ \hat{H} \circ (h \circ f_0, h \circ f_0)^{-1} = h_0 \circ \hat{H} \circ ((f_0)^{-1} \circ h^{-1}, (f_0)^{-1} \circ h^{-1})$$
is also uniformly continuous on \((h[f_0[E_0]])^2\). Put \(E_1 = f_0[E_0]\) and notice that it is as desired.

Indeed, clearly \(E_1 \in P_\alpha\) and \(E_1 \subset E\). Moreover, it is not difficult to see that \(G \upharpoonright (h[E_1])^2 \setminus \Delta = \hat{G} \upharpoonright (h[E_1])^2 \setminus \Delta\). So \(G\) is uniformly continuous on \((h[E_1])^2 \setminus \Delta\).

\[\] 6. \textbf{Theorem 3.5: on } \text{cov} (D^n, C^n) < c

In the proof we will use the following lemma.

\textbf{Lemma 6.1} For \(n < \omega\) let \(f \in C^n\) and let \(P \subset \mathbb{R}\) be a perfect set for which the function \(F: P^2 \setminus \Delta \to \mathbb{R}\) defined by

\[F(x, y) = \frac{f^{(n)}(x) - f^{(n)}(y)}{x - y}\]

is uniformly continuous and bounded. Then \(f \upharpoonright P\) can be extended to a \(C^{n+1}\) function.

\textbf{Proof.} This follows from the fact that \(f \upharpoonright P\) satisfies the assumptions of Whitney’s extension theorem. To see this notice first that \(F\) naturally extends to a continuous function on \(P^2\) with \(F(a, a) = f^{(n+1)}(a)\). Next, for \(q = 1, 2, 3, \ldots\) and \(a \in P\) let

\[\eta_q(a) = \sup \left\{ \left| \frac{f^{(n)}(x) - f^{(n)}(a)}{x - a} - f^{(n+1)}(a) \right| : 0 < |x - a| < \frac{1}{q} \right\} .\]

In the second part of the proof of [15, Thm. 3.1.15] it is shown that if

\[\lim_{q \to \infty} \sup \{\eta_q(a) : a \in P\} = 0\]

then \(f \upharpoonright P\) satisfies the assumptions of Whitney’s extension theorem. However we have

\[\frac{f^{(n)}(x) - f^{(n)}(a)}{x - a} - f^{(n+1)}(a) = F(x, a) - F(a, a),\]

so uniform continuity of \(F\) clearly implies (20). \[\]
Proof of Theorem 3.5. The lower bound inequalities \( \text{cov}(D^n, \mathcal{C}^n) > \omega \) and \( \text{cov}("D^n", \mathcal{C}^n) > \omega \) follow from Example 7.7. So it is enough to prove only that these numbers are \( \leq \omega_1 \).

To prove \( \text{cov}(D^n, \mathcal{C}^n) \leq \omega_1 \), take an \( f \in D^n \) and note that, by CPA\(_{\text{prism}}\), it is enough to show that the following set

\[
\mathcal{E} = \{ E \in \text{Perf}(\mathbb{R}) : (\exists h \in \mathcal{C}^n(\mathbb{R})) \ h \upharpoonright E = f \upharpoonright E \}
\]

is \( \mathcal{F}_{\text{prism}} \)-dense. So fix a prism \( P \) in \( \mathbb{R} \). Let \( k : [\neg \infty, \infty] \to [0, 1] \) be a homeomorphism. Applying \( n \)-times Proposition 4.1 in the same way as in the proof of Lemma 4.2 we find a subprism \( E \) of \( P \) such that for each \( i < n \) the function \( k \circ F_i : E^2 \setminus \Delta \to [0, 1] \) is uniformly continuous, where \( F_i : E^2 \setminus \Delta \to \mathbb{R} \) is defined by

\[
F_i(x, y) = \frac{f^{(i)}(x) - f^{(i)}(y)}{x - y}.
\]

So each \( F_i \) can be extended to a continuous function \( \bar{F}_i : E^2 \to [-\infty, \infty] \). Note also that since \( \bar{F}_i(x, x) = f^{(i+1)}(x) \in \mathbb{R} \), as \( f \in D^n \), we in fact have \( \bar{F}_i[E^2] \subset \mathbb{R} \).

Next, starting with \( f_0 = f \) we use Lemma 6.1 to prove by induction that for every \( i < n \) there exists an \( f_{i+1} \in \mathcal{C}^{i+1}(\mathbb{R}) \) extending \( f_i \upharpoonright E \). Then function \( h = f_n \in \mathcal{C}^n(\mathbb{R}) \) witnesses that \( E \in \mathcal{E} \).

To prove \( \text{cov}("D^n", \mathcal{C}^n) \leq \omega_1 \), take an \( f \in "D^n" \). As before it is enough to show that

\[
\mathcal{E}’ = \{ E' \in \text{Perf}(\mathbb{R}) : (\exists h \in "\mathcal{C}^n(\mathbb{R})") \ h \upharpoonright E' = f \upharpoonright E' \}
\]

is \( \mathcal{F}_{\text{prism}} \)-dense. So fix a prism \( P \) in \( \mathbb{R} \) and find \( E, F_i \)’s, and \( \bar{F}_i \)’s as above. Note that \( F_i \)’s are well defined since \( f \in "D^n" \subset \mathcal{C}^{n-1} \). By the same reason we have that \( \bar{F}_i[P^2] \subset \mathbb{R} \) for all \( i < n - 1 \). However, \( \bar{F}_{n-1} \) can have infinite values.

Proceeding as in the proof of Lemma 4.2, decreasing \( E \) if necessary, we can assume that either the range of \( \bar{F}_{n-1} \) is bounded or \( \bar{F}_{n-1} \upharpoonright P^2 \cap \Delta \) is constant equal to \( \infty \) or \( -\infty \). If \( \bar{F}_{n-1} \) is bounded then, taking \( E’ = E \), we are done as in the previous case. So, assume that \( \bar{F}_{n-1}[P^2 \cap \Delta] = \{ \infty \} \). (The case of \( -\infty \) is handled by replacing \( f \) with \( -f \).) Then \( f^{(n-1)} \) and \( E \) satisfy the assumptions of Brown’s version of Whitney’s extension theorem [3, Thm. 2.1]. So, we can find a “\( \mathcal{C}^1 \)” extension \( g : \mathbb{R} \to \mathbb{R} \) of \( f^{(n-1)} \upharpoonright E \) such that \( g'[E] = (f^{(n-1)})'[E] = \{ \infty \} \) and \( g'[\mathbb{R} \setminus E] \subset \mathbb{R} \). By \( (n-1) \)-times integrating
for $x$

Define a strictly increasing function $f$ such that $G^{(n-1)} = g$. Then $G \in \mathcal{C}^n$. Next notice that $G - f \in \mathcal{C}^n(E)$, since $(G - f)^{(n-1)} = g - f^{(n-1)} \equiv 0$ on $E$. Now, proceeding as above for the case of $f \in \mathcal{C}^n$ we can find a subprism $E'$ of $E$ and a function $\hat{h} \in \mathcal{C}^n(\mathbb{R})$ extending $G - f \upharpoonright E'$. Then function $h = G - \hat{h}$ belongs to $\mathcal{C}^n$ as a difference of functions from $\mathcal{C}^n$ and $\mathcal{C}^n$. Moreover, $h$ extends $f \upharpoonright E'$ since $h = G - \hat{h} = G - (G - f) = f$ on $E'$. So, $h$ witnesses $E' \in \mathcal{E}'$.

\section{Examples related to $\text{cov}$ operator}

We will start with the examples needed for the proof of Proposition 3.4 which give $c$ as a lower bound for the appropriate numbers $\text{cov}(A, \mathcal{F})$.

\textbf{Example 7.1} There exist a homeomorphism $h: \mathbb{R} \to \mathbb{R}$ and a perfect set $P \subset \mathbb{R}$ such that $h, h^{-1} \in \mathcal{C}^2$, $h'' \upharpoonright P \equiv \infty$, and $(h^{-1})'' \upharpoonright h[P] \equiv -\infty$. In particular, $-\text{IntTh}(h \upharpoonright P, D_{\text{perf}}^2 \cup (D_{\text{perf}}^2)^{-1})$ and

\[ \text{cov} \left( \mathcal{C}^2, D_{\text{perf}}^2 \cup (D_{\text{perf}}^2)^{-1} \right) = \text{cov} \left( h, D_{\text{perf}}^2 \cup (D_{\text{perf}}^2)^{-1} \right) = c. \]

\textbf{Proof.} First notice that there exist a strictly increasing homeomorphism $h_0$ from $\mathbb{R}$ onto $(0, \infty)$ and a perfect set $P \subset \mathbb{R}$ such that

\[ h_0 \in \mathcal{C}^1 \quad \text{and} \quad h_0' \upharpoonright P \equiv \infty. \quad (21) \]

Indeed, let $C$ be an arbitrary nowhere dense perfect subset of $[2, 3]$ with $2 \in C$ and let $d(x)$ denotes the distance between $x \in \mathbb{R}$ and $C$. Let $f_0: (0, \infty) \to [0, \infty)$ be defined by $f_0(x) = x^{-2}$ for $x \in (0, 1]$ and $f_0(x) = d(x)$ for $x \in [1, \infty)$. Then $f_0$ is continuous and $f_0(x) = 0$ precisely when $x \in C$. Define a strictly increasing function $f$ from $(0, \infty)$ onto $\mathbb{R}$ by a formula

\[ f(x) = \int_1^x f_0(t) \, dt. \]

Then $f' = f_0$ and $f(x) = 1 - \frac{1}{x}$ on $(0, 1)$. It is easy to see that $h_0 = f^{-1}$ and $P = f[C] \subset (0, \infty)$ satisfy (21).

Now put $h(x) = \int_0^x h_0(t) \, dt$. Then clearly $h$ is strictly increasing since $h_0$ is positive. Also $h$ is onto $\mathbb{R}$ as on $(-\infty, 0)$ we have $h_0(x) = \frac{1}{1-x^2}$ and so $h(x) = -\ln(1 - x)$. It is easy to see that $h' = h_0$ so, by (21), $h \in \mathcal{C}^2$ and $h'' \upharpoonright P \equiv \infty$. Also, if $g = h^{-1}$ then $g'(x) = 1/h'(g(x)) = 1/h_0(g(x)) > 0$ is strictly decreasing and $h^{-1} = g \in \mathcal{C}^1$. Thus, to see that $h^{-1} = g \in \mathcal{C}^2$ and that $(h^{-1})'' \equiv -\infty$ on $h[P] = h[f[C]]$ it is enough to differentiate $g'(x)$ (note that the differentiation formulas are valid, if just one of the terms is infinite).
to get $g''(x) = -[h'(g(x))]^{-2}h''(g(x))g'(x) = -h''(g(x))(g'(x))^3$. Thus, $h$ and $P$ have the desired properties.

To see the additional part note first that for every $f \in D^2_{\text{perf}}$ functions $f$ and $h \upharpoonright P$ may agree on at most countable set $S$ since at any point $x$ of a perfect subset $Q$ of $S$ we would have

$$(h \upharpoonright Q)''(x) = \infty \neq (f \upharpoonright Q)''(x).$$

Similarly, $|f \cap (h \upharpoonright P)| \leq \omega$ for every $f \in (D^2_{\text{perf}})^{-1}$. This clearly implies the additional part. ■

**Example 7.2** There exists a perfect set $P \subset \mathbb{R}$ and a function $f \in \mathcal{C}^1$ such that $f'(x) = \infty$ for every $x \in P$. In particular, $\neg \text{IntTh}(f \upharpoonright P, D^1_{\text{perf}})$ and

$$\text{cov}(\text{Borel}, \mathcal{C}^1) = \text{cov}(\mathcal{C}^1, \mathcal{C}^1) = \text{cov}(\mathcal{C}^1, D^1_{\text{perf}}) = \text{cov}(f, D^1_{\text{perf}}) = \mathfrak{c}.$$

**Proof.** If $f$ is a function $h_0$ from (21) then it has the desired properties.

For such an $f$ and any function $g \in D^1_{\text{perf}}$ the intersection $f \cap g$ must be finite. So

$$\mathfrak{c} \geq \text{cov}(\text{Borel}, \mathcal{C}^1) \geq \text{cov}(\mathcal{C}^1, D^1_{\text{perf}}) \geq \text{cov}(f, D^1_{\text{perf}}) \geq \mathfrak{c}.$$

Monotonicity of cov operator gives the other equations. ■

**Example 7.3** For every $0 < n < \omega$ there exists an $f \in \mathcal{C}^n$ and a perfect set $P \subset \mathbb{R}$ such that $\neg \text{IntTh}(f \upharpoonright P, D^n_{\text{perf}})$ so that

$$\text{cov}(\mathcal{C}^n, \mathcal{C}^n) = \text{cov}(\mathcal{C}^n, D^n_{\text{perf}}) = \text{cov}(f, D^n_{\text{perf}}) = \mathfrak{c}.$$

**Proof.** For $n = 1$ this is a restatement of Example 7.2. The general case can be done by induction: If $f$ is good for some $n$ and $F$ is a definite integral of $f$ then $F \in \mathcal{C}^{n+1}$ and $\neg \text{IntTh}(F \upharpoonright P, D^{n+1}_{\text{perf}}) = \mathfrak{c}$. ■

**Example 7.4** There exists an $f \in \mathcal{C}^1$ and a perfect set $P \subset \mathbb{R}$ such that $|f \cap g| \leq \omega$ for every $g \in \mathcal{C}^2$. In particular, $\neg \text{IntTh}(f \upharpoonright P, \mathcal{C}^2)$ and

$$\text{cov}(\mathcal{C}^1, \mathcal{C}^2) = \text{cov}(f, \mathcal{C}^2) = \mathfrak{c}.$$
Proof. In [1, Thm. 22] the authors construct a perfect set $P \subset [0, 1]$ and a function $f \in C^1$ which have the desired properties. The argument for this is implicitly included in the proof of [1, Thm. 22] and goes like that.

Function $f$ has the property that $f'(x) = 0$ for all $x \in P$. Now, assume that some $g \in "D^2"$ agrees with $f$ on a perfect set $Q \subset P$. Then clearly we would have $(g \upharpoonright Q)'' = [(g \upharpoonright Q)']' = [(f \upharpoonright Q)']' = \{0\}'$ $\equiv 0$. On the other hand, in [1, Thm. 22] it is shown\footnote{Actually, the calculation in [1, thm. 22] is done under the assumption that $g \in C^2$, but it works also under our weaker assumption that $g \in "D^2"$.} that for such a $g$ we would have $g''(x) \in \{\pm \infty\}$ for every $x \in Q$, a contradiction.

Example 7.5 For every $0 < n < \omega$ there exist an $f \in C^n$ and a perfect set $P \subset \mathbb{R}$ such that $\neg \text{IntTh}(f \upharpoonright P, "D^{n+1}" )$ and

$$\text{cov}(C^n, "D^{n+1}" ) = \text{cov}(f, "D^{n+1}" ) = \mathfrak{c}.$$ 

Proof. For $n = 1$ this is a restatement of Example 7.4. The general case can be done by induction: If $f$ is good for some $n$ and $F$ is a definite integral of $f$ then $F \in C^{n+1}$ and $\neg \text{IntTh}(F \upharpoonright P, D^{n+1}_{\text{perf}})$ $= \mathfrak{c}$.  

Next we will describe the examples showing that the $\text{cov}(\mathcal{A}, \mathcal{F})$ numbers considered in Corollary 3.3 and Theorem 3.5 have values greater than $\omega$. In what follows $\text{cov}(\mathcal{M})$ ($\text{cov}(\mathcal{N})$, respectively) will stand for the smallest cardinality of a family $\mathcal{F} \subset \mathcal{P}(\mathbb{R})$ of measure zero sets (nowhere dense, respectively) such that $\mathbb{R} = \bigcup \mathcal{F}$.

Example 7.6 There exists a function $f \in D^1$ such that

$$\text{cov}(f, "C^1" \cup (D^1)^{-1}) \geq \text{cov}(\mathcal{M}) > \omega.$$ 

In particular

$$\text{cov}(\text{Borel}, "C^1") \geq \text{cov}(D^1, "C^1") \geq \text{cov}(\mathcal{M}) > \omega$$ 

and

$$\text{cov}(\text{Borel}, C^1 \cup (C^1)^{-1}) \geq \text{cov}(D^1, C^1 \cup (C^1)^{-1}) \geq \text{cov}(\mathcal{M}) > \omega.$$
PROOF. We will construct function $f$ only on $[0, 1]$. It can be easily modified to a function defined on $\mathbb{R}$.

Let $E \subset [0, 1]$ be an $F_{\sigma}$-set of measure 1 such that $E^c = [0, 1] \setminus E$ is dense in $[0, 1]$. It is well known that there exists a derivative $g: [0, 1] \to [0, 1]$ such that $g[E] \subset (0,1]$ and $g[E^c] = \{0\}$. (See e.g. [5, p. 24,]) Let $f: [0, 1] \to \mathbb{R}$ be such that $f' = g$. We claim that this $f$ is as desired.

Indeed, by way of contradiction assume that for some $\kappa < \text{cov}(\mathcal{M})$ there exists a family $\{h_\xi \in \mathbb{R}: \xi < \kappa\} \subset \{C^1\} \cup (D^1)^{-1}$ such that $f \subset \bigcup_{\xi < \kappa} h_\xi$. Since $h_\xi$ are closed subsets of $\mathbb{R}^2$ and the graph of $f$ is compact, we see that the $x$-coordinate projections $P_\xi = \pi_x[f \cap h_\xi]$ are closed. So, $[0,1]$ is covered by less than $\text{cov}(\mathcal{M})$ closed sets $P_\xi$. Thus, there exists an $\eta < \kappa$ such that $P_\eta$ has non-empty interior $U = \text{int}(P_\eta)$.

Now, if $h_\eta \in \{C^1\}$ then $h_\eta' = f' = g$ on $U$, which is impossible, since $h_\eta'$ is continuous, while $g$ is not continuous on any non-empty open set. So assume that $h_\eta \in (D^1)^{-1}$. Note that $f$ is strictly increasing as an integral of function $g$ which is strictly positive a.e. So $f^{-1}$ is a strictly increasing and agrees with $h = h_\eta^{-1} \in D^1$ on an open set $f[U]$. But then if $x \in U \setminus E$ then $h'(f(x)) = (f^{-1})'(f(x)) = \frac{1}{f(x)} = \infty$ which contradicts $h \in D^1$. 

Note also that if $f$ from Example 7.6 is replaced by its $(n-1)$-st antiderivative then we get also the following example.

**Example 7.7** For any $0 < n < \omega_1$ there exists an $f \in D^n$ such that

$$\text{cov}(D^n, \{C^n\}) \geq \text{cov}(f, \{C^n\}) \geq \text{cov}(\mathcal{M}) > \omega.$$ 

**Example 7.8** There exists an $f \in C^0$ such that

$$\text{cov}(C^0, \{D^1_{\text{perf}}\}) \geq \text{cov}(f, \{D^1_{\text{perf}}\}) \geq \text{cov}(\mathcal{N}) > \omega.$$ 

Moreover, for every $n < \omega$ if $F \in C^n$ is such that $F^{(n)} = f$ then

$$\text{cov}(C^n, \{D^1_{\text{perf}}\}) \geq \text{cov}(F, \{D^1_{\text{perf}}\}) \geq \text{cov}(\mathcal{N}) > \omega$$

and

$$\text{cov}(\text{Borel, } \{C^{\infty}_{\text{perf}}\}) \geq \text{cov}(C^n, \{C^{\infty}_{\text{perf}}\}) \geq \text{cov}(F, \{C^{\infty}_{\text{perf}}\}) \geq \text{cov}(\mathcal{N}) > \omega.$$ 

**PROOF.** A continuous function $f$ justifying $\text{cov}(f, \{D^1_{\text{perf}}\}) \geq \text{cov}(\mathcal{N})$ was pointed by Morayne: just take any $f \in C$ for which there is a set $A \subset \mathbb{R}$ of positive measure for which $|f^{-1}(a)| = c$ for all $a \in A$. (See [26, Thm. 6.1].)
To see the additional part, let $G = \{g_\xi : \xi < \kappa\}$ be an infinite subset of $D_{\text{perf}}^{n+1} \cup C_{\text{perf}}^\infty$ such that $F \subset \bigcup G$. We need to show that $\kappa \geq \text{cov}(N)$. For this first note that for every $\xi < \kappa$ the domain of $F \cap g_\xi$ can be represented as a union of a perfect set $P_\xi$ (which can be empty) and a countable (scattered) set $S_\xi$. Let $S = \bigcup_{\xi < \kappa} S_\xi$ and note that it has cardinality at most $\kappa$. Since $F \upharpoonright P_\xi = g_\xi \upharpoonright P_\xi$, by an easy induction on $i \leq n$ we can prove that

$$F(i) \upharpoonright P_\xi = (g_\xi \upharpoonright P_\xi)^{(i)} \quad \text{provided } g_\xi \in "D_{\text{perf}}^i" \text{ and } P_\xi \neq \emptyset.$$ 

Thus, if $g_\xi \in "D_{\text{perf}}^{n+1}"$ and $P_\xi \neq \emptyset$ then $f \upharpoonright P_\xi = F^{(n)} \upharpoonright P_\xi = (g_\xi \upharpoonright P_\xi)^{(n)} \in "D_{\text{perf}}^1"$.

On the other hand, if $g_\xi \in "C_{\text{perf}}^\infty \setminus "D_{\text{perf}}^{n+1}"$ then $P_\xi = \emptyset$.

Indeed, otherwise there is an $i \leq n$ such that $g_\xi \in "D_{\text{perf}}^i"$ and $g_\xi^{(i)}$ is constant equal to $\infty$ or $-\infty$. So, by (22), for any $x \in P_\xi$ a real number $F^i(x)$ belongs to $\{-\infty, \infty\}$, a contradiction.

Thus $F = \{f \upharpoonright P_\xi : \xi < \kappa \& P_\xi \neq \emptyset\} \cup \{f \upharpoonright \{x\} : x \in S\} \subset "D_{\text{perf}}^1"$ has cardinality at most $\kappa$ and it covers $f$. So, by the first part, $\kappa \geq \text{cov}(N)$. 

\section{8 Proof of Fusion Lemma 2.1}

Notice that if $P \in \mathbb{P}_\alpha$ and $0 < \beta < \alpha$ then

$$P \cap \pi^{-1}_\beta(P') \in \mathbb{P}_\alpha \quad \text{for every } P' \in \mathbb{P}_\beta \text{ with } P' \subset \pi_\beta[P].$$ 

Indeed, let $f \in \Phi_{\text{prism}}(\beta)$ and $g \in \Phi_{\text{prism}}(\alpha)$ be such that $f[\mathcal{C}^\beta] = P'$ and $g[\mathcal{C}^\alpha] = P$. Let $Q = (g \upharpoonright \beta)^{-1}[P'] = (g \upharpoonright \beta)^{-1} \circ f[\mathcal{C}^\beta]$. Then, $Q \in \mathbb{P}_\beta$ since, by (5), $(g \upharpoonright \beta)^{-1} \circ f \in \Phi_{\text{prism}}(\beta)$. Thus $\pi^{-1}_\beta(Q)$ belongs to $\mathbb{P}_\alpha$ and $P \cap \pi^{-1}_\beta(P') = g[\pi^{-1}_\beta(Q)] \in \mathbb{P}_\alpha$.

For a fixed $0 < \alpha < \omega_1$ let $\{(\beta_k, n_k) : k < \omega\}$ be an enumeration of $\alpha \times \omega$ used in the definition (1) of the metric $\rho$ and let

$$A_k = \{(\beta_i, n_i) : i < k\} \quad \text{for every } k < \omega.$$ 

(24)
Lemma 8.1 (Master Fusion Lemma) Let $0 < \alpha < \omega_1$ and for every $k < \omega$ let $\mathcal{E}_k = \{E_s \in \mathbb{P}_\alpha : s \in 2^A_k\}$. Assume that for every $k < \omega$, $s, t \in 2^A_k$, and $\beta < \alpha$ we have:

(i) the diameter of $E_s$ is less than or equal to $2^{-k}$,

(ii) if $r \in \bigcup_{i<\omega} 2^{A_i}$ and $r \subseteq s$ then $E_s \subseteq E_r$,

(iii) if $s \upharpoonright (\beta \times \omega) = t \upharpoonright (\beta \times \omega)$ then $\pi_\beta[E_s] = \pi_\beta[E_t]$,

(iv) if $s \upharpoonright (\beta \times \omega) \neq t \upharpoonright (\beta \times \omega)$ then $\pi_\beta[E_s] \cap \pi_\beta[E_t] = \emptyset$.

Then $Q = \bigcap_{k<\omega} \bigcup \mathcal{E}_k$ belongs to $\mathbb{P}_\alpha$.

**Proof.** For $x \in \mathfrak{C}^\alpha$ let $\bar{x} \in 2^{\alpha \times \omega}$ be defined by $\bar{x}(\beta, n) = x(\beta)(n)$.

First note that, by conditions (i) and (iv), for every $k < \omega$ the sets in $\mathcal{E}_k$ are pairwise disjoint and each of the diameter at most $2^{-k}$. Thus, taking into account (ii), function $h : \mathfrak{C}^\alpha \rightarrow \mathfrak{C}^\alpha$ defined by

$$h(x) = r \iff \{r\} = \bigcap_{k<\omega} E_{\bar{x} \upharpoonright A_k}$$

is well defined and is one-to-one. It is also easy to see that $h$ is continuous and that $Q = h[\mathfrak{C}^\alpha]$. Thus, we need to prove only that $h \in \Phi_{\text{prism}}(\alpha)$, that is, that $h$ is projection-keeping.

To show this fix $\beta < \alpha$, put $S = \bigcup_{i<\omega} 2^{A_i}$, and notice that, by (i) and (iii), for every $x \in \mathfrak{C}^\alpha$ we have

$$\{h(x) \upharpoonright \beta\} = \pi_\beta \left[ \bigcap \{E_{\bar{x} \upharpoonright A_k} : k < \omega\} \right]$$

$$= \bigcap \{\pi_\beta[E_{\bar{x} \upharpoonright A_k}] : k < \omega\}$$

$$= \bigcap \{\pi_\beta[E_s] : s \in S \land s \subseteq \bar{x}\}$$

$$= \bigcap \{\pi_\beta[E_s] : s \in S \land s \upharpoonright (\beta \times \omega) \subseteq \bar{x}\}.$$ 

Now, if $x \upharpoonright \beta = y \upharpoonright \beta$ then for every $s \in S$

$$s \upharpoonright (\beta \times \omega) \subseteq \bar{x} \iff s \upharpoonright (\beta \times \omega) \subseteq \bar{y}$$

so $h(x) \upharpoonright \beta = h(y) \upharpoonright \beta$. 

On the other hand, if $x \upharpoonright \beta \neq y \upharpoonright \beta$ then there exists $k < \omega$ big enough such that for $s = \bar{x} \upharpoonright A_k$ and $t = \bar{y} \upharpoonright A_k$ we have $s \upharpoonright (\beta \times \omega) \neq t \upharpoonright (\beta \times \omega)$. But then $\{h(x) \upharpoonright \beta\}$ and $\{h(y) \upharpoonright \beta\}$ are subsets of $\pi_\beta[E_s]$ and $\pi_\beta[E_t]$, respectively, which, by (iv), are disjoint. So, $h(x) \upharpoonright \beta \neq h(y) \upharpoonright \beta$.

**Proof of Lemma 2.1.** Let us define $D_{-1} = \{\{C^\alpha\}\}$. It is enough to construct a sequence $\langle E_k \in D_{k-1}: k < \omega \rangle$ satisfying conditions (i)-(iv) from Lemma 8.1. This will be done by induction on $k < \omega$.

We start with $E_0 = \{C^\alpha\}$. Clearly at this stage (i)-(iv) are satisfied. So, assume that for some $k < \omega$ a sequence $\langle E_j: j \leq k \rangle$ satisfying (i)-(iv) is already defined. We will construct $E_{k+1}$.

Let $\{s_i: i < 2^k\}$ be an enumeration of $2^{\mathbb{A}_k}$. Thus $E_k = \{E_{s_i}: i < 2^k\}$. Also, let $\gamma = \max\{\beta_0, \ldots, \beta_k\} < \alpha$, and for every $i, m < 2^k$ put

$$\beta_i^m = \max\{\beta \leq \gamma: s_i \upharpoonright (\beta \times \omega) = s_m \upharpoonright (\beta \times \omega)\}.$$

As a first step of the proof we will construct, by induction on $m \leq 2^k$, the sequences $\{E_{s_n}^m \in \mathbb{A}: i < 2^k\}$ such that for every $n < m \leq 2^k$ and $i < 2^k$

(a) $E^m = \{E_{s_i} \in \mathbb{A}: i < 2^k\}$ satisfies (iii),

(b) $E^m_n \supset E^m_{s_n}$,

(c) $P^0_n$ and $P^1_n$ are disjoint subsets of $E^m_{s_n}$ such that $\{P^0_n, P^1_n\} \in D_k$ and $\pi_\gamma[P^0_n] = \pi_\gamma[P^1_n] = \pi_\gamma[E^m_{s_n+1}]$.

We start with putting $E_{s_i}^0 = E_{s_i}$ for every $i < 2^k$. So, (a)-(c) clearly hold. Next, if for an $m < 2^k$ family $E^m$ satisfying (iii) is already constructed apply (P3) to find disjoint $P^0_m, P^1_m \in D_k$ subsets of $E^m_{s_m}$ for which $\pi_\gamma[P^0_m] = \pi_\gamma[P^1_m]$. Then for $i < 2^k$ we put

$$E_{s_i}^{m+1} = E_{s_i}^m \cap \pi_\gamma^{-1}(\pi_\beta^m[P^0_m]) = \{x \in E_{s_i}^m: x \upharpoonright \beta_i^m \in \pi_\beta^m[P^0_m]\}. \quad (25)$$

Notice that $\pi_\beta^m[P^0_m] \subset \pi_\beta^m[E_{s_m}^m] = \pi_\beta^m[E_{s_n}^m]$, so, by (23), $E_{s_i}^{m+1} \in \mathbb{A}$. Also, by the inductive assumption (a),

$$\pi_\beta^m[E_{s_i}^{m+1}] = \pi_\beta^m[E_{s_i}^m] \cap \pi_\beta^m[P^0_m] = \pi_\beta^m[E_{s_m}^m] \cap \pi_\beta^m[P^0_m] = \pi_\beta^m[P^0_m].$$

Since $\beta_i^m = \gamma$, this implies immediately (c). It is clear that (b) holds. Thus, it is enough to show that $E^{m+1}$ satisfies (iii). So, pick $\beta < \alpha$ and different
\[ i < j < 2^k \text{ such that } s_i \upharpoonright (\beta \times \omega) = s_j \upharpoonright (\beta \times \omega). \] If \( \beta \leq \beta_i^m \) then also \( \beta \leq \beta_j^m \) and \( \pi_\beta[E_{s_i}^{m+1}] = \pi_\beta[P_0^m] = \pi_\beta[E_{s_j}^{m+1}] \). So, assume that \( \beta > \beta_i^m \) and \( \beta > \beta_j^m \). Then \( \beta_i^m = \beta_j^m \) and

\[
\pi_\beta[E_{s_i}^{m+1}] = \{ \pi_\beta(x) : x \in E_{s_i}^m & \pi_\beta(x) \upharpoonright \beta_i^m \in \pi_\beta[P_0^m] \} \\
= \{ \pi_\beta(x) : x \in E_{s_i}^m & \pi_\beta(x) \upharpoonright \beta_j^m \in \pi_\beta[P_0^m] \} \\
= \pi_\beta[E_{s_j}^{m+1}].
\]

So \( E^{m+1} \) satisfies (iii). This finishes the construction.

Next for \( i < 2^k \) put \( E_i' = E_i^{\beta_i} \subset E_i \) and notice that

(P3') for every \( n < 2^k \) there are disjoint \( F_0^0, F_1^1 \in A \) such that \( F_0^0 \cup F_1^1 \subset E_n^\gamma \), \( \{ F_0^0, F_1^1 \} \in D_k \), and \( \pi_\gamma[F_0^0] = \pi_\gamma[F_1^1] = \pi_\gamma[E_n^\gamma] \).

Indeed, for \( j < 2 \) define \( F_j^j = P_n^1 \cap \pi_\gamma^{-1}(\pi_\gamma[E_n^\gamma]) \) and note that \( F_j^j \in A \) by (23), since \( \pi_\gamma[E_n^\gamma] \subset \pi_\gamma[E_n^{m+1}] = \pi_\gamma[P_0^m] \). So, \( \{ F_0^0, F_1^1 \} \in D_k \) by (P1). The equations hold since, by (c),

\[
\pi_\gamma[F_j^j] = \{ \pi_\gamma(x) : x \in P_n^1 & x \upharpoonright \gamma \in \pi_\gamma[E_n^\gamma] \} \\
= \{ \pi_\gamma(x) : x \in E_n^{m+1} & x \upharpoonright \gamma \in \pi_\gamma[E_n^\gamma] \} \\
= \pi_\gamma[E_n^\gamma].
\]

Finally, \( F_j^j = \{ x \in P_n^1 : x \upharpoonright \gamma \in \pi_\gamma[E_n^\gamma] \} \) is a subset of \( E_n^\gamma \) since \( P_n^1 \subset E_n^{m+1} \) and, by (25), if \( x \in E_n^{m+1} \setminus E_n^\gamma \) then \( x \upharpoonright \gamma \notin \pi_\gamma[E_n^\gamma] \). So, (P3') holds.

Next, by induction on \( i < 2^k \), choose a sequence \( \langle x_{j}^{i} : j < 2 & i < 2^{k} \rangle \) such that for every \( j < 2 \) and \( m \leq i < 2^k \)

\[ x_{0}^{i} \upharpoonright \beta_{k} = x_{1}^{i} \upharpoonright \beta_{k}, \ x_{0}^{i}(\beta_{k}) \neq x_{1}^{i}(\beta_{k}), \text{ and } x_{i}^{j} \upharpoonright \beta_{i}^{m} = x_{m}^{j} \upharpoonright \beta_{i}^{m}. \] (26)

By (P3') it is easy to find \( x_{0}^{0} \) and \( x_{1}^{0} \) satisfying (26). So, assume that for some \( 0 < i < 2^k \) we already have defined \( \langle x_{m}^{j} : j < 2 & m < i \rangle \). To find \( x_{i}^{0} \) and \( x_{i}^{1} \) let \( \beta = \max\{ \beta_{i}^{m} : m < i \} \) and choose an \( n < i \) which witnesses it, that is such that \( \beta = \beta_{i}^{n} \). Since, by (a) and (P3'), \( \pi_\beta[F_{i}^{n}] = \pi_\beta[F_{j}^{n}] \), for \( j < 2 \), we can find an \( x_{i}^{0} \in F_{0}^{n} \) extending \( x_{n}^{0} \upharpoonright \beta \). Then \( x_{i}^{0} \upharpoonright \beta_{i}^{m} = x_{n}^{0} \upharpoonright \beta_{i}^{m} = x_{m}^{0} \upharpoonright \beta_{i}^{m} \) for all \( m < i \).

Next, if \( \beta_{k} < \beta \) as above we choose an \( x_{i}^{1} \in F_{i}^{n} \) extending \( x_{n}^{1} \upharpoonright \beta \) and note that (26) is satisfied since this was the case for \( i = n \). So, assume that
\[ \beta \leq \beta_k \leq \gamma. \] Then, by (P3'), we can find an \( x^1_i \in F^1_{s_i} \) extending \( x^0_i | \beta \) such that \( x^1_i(\beta_k) \neq x^0_i(\beta_k) \). Then (26) holds as well.

Finally, for \( s \in 2^{A_k} \) and \( j < 2 \) let \( s \hat{\cup} j \) stand for \( s \cup \{(\beta_k, n_k), j\} \) in \( 2^{A_k+1} \) and for \( i < 2^k \) define
\[ E_{s_i \hat{\cup} j} = F^j_{s_i} \cap B_\alpha(x^j_i, 2^{-k}). \]

Let \( \mathcal{E}_{k+1} = \{ E_s : s \in 2^{A_{k+1}} \} \). To finish the proof it is enough to show that \( \mathcal{E}_{k+1} \) satisfies (i)-(iv) from Lemma 8.1. Thus, (i) follows from the fact that \( E_{s_i \hat{\cup} j} \subset B_\alpha(x^j_i, 2^{-k}) \); (ii) is justified by \( E_{s_i \hat{\cup} j} \subset F^j_{s_i} \subset E'_{s_i} \subset E_{s_i} \); while (iii) and (iv) can be easily deduced from (P3'), (26), and (2).
